

The RESATER library is a repository of content, reports and publications that complement the dissemination of the tasks performed in the associated telemedicine platform, thereby promoting greater disclosure of the above-mentioned. This library is divided into three parts: the first differentiating a project library, the second communications and the final research. Access to all these libraries is provided via the vertical menu that you can see, with the tabs on projects, research, reports, publications and legislation.

The importance of the ability to create a collaborative space, by exploiting new technologies, serves as a stimulus for continuing education among professionals to become reality in the sector. All the disclosure will enable further investigation and widen knowledge gained from actions already performed, contrasting and /or promoting new lines of thought about the subject.

Finally, it is noteworthy that a publication reviewed by a community of users gives a higher reputation and reliability for future studies associated with it, so all the information exchange in this workspace will serve to facilitate future proposals.
